DISTRIBUTION UTILITY MEET DUM 2026

ORGANIZER: ISGF India Smart Grid Forum

HOST UTILITIES: JVVNL | Jodhpur Vidyut Vitran Nigam Limited | Ajmer Vidyut Vitran Nigam Limited

CO - HOST UTILITIES: TATA POWER | Chandigarh Power Distribution Limited (CPDL) | TATA POWER-DDL | BSES Rajdhani Power Limited | NPCL | BSES Yamuna Power Limited

KNOWLEDGE PARTNER: Power Foundation of India

POWERED BY: Pelocal

RE PARTNER: RREC

DUM 2026 CONFERENCE SESSION

India Energy Stack Expert Panel at DUM 2026

FROM ENERGY DATA TO TRUSTED TRANSACTIONS

Presented By

Er. Nallasivan C| IT–Department | Tamil Nadu Power Distribution Corporation Ltd

Distribution Utility Meet | 27 - 28 October 2026 | www.dumindia.in

India’s electricity system is undergoing two transformations :

ENERGY TRANSITION

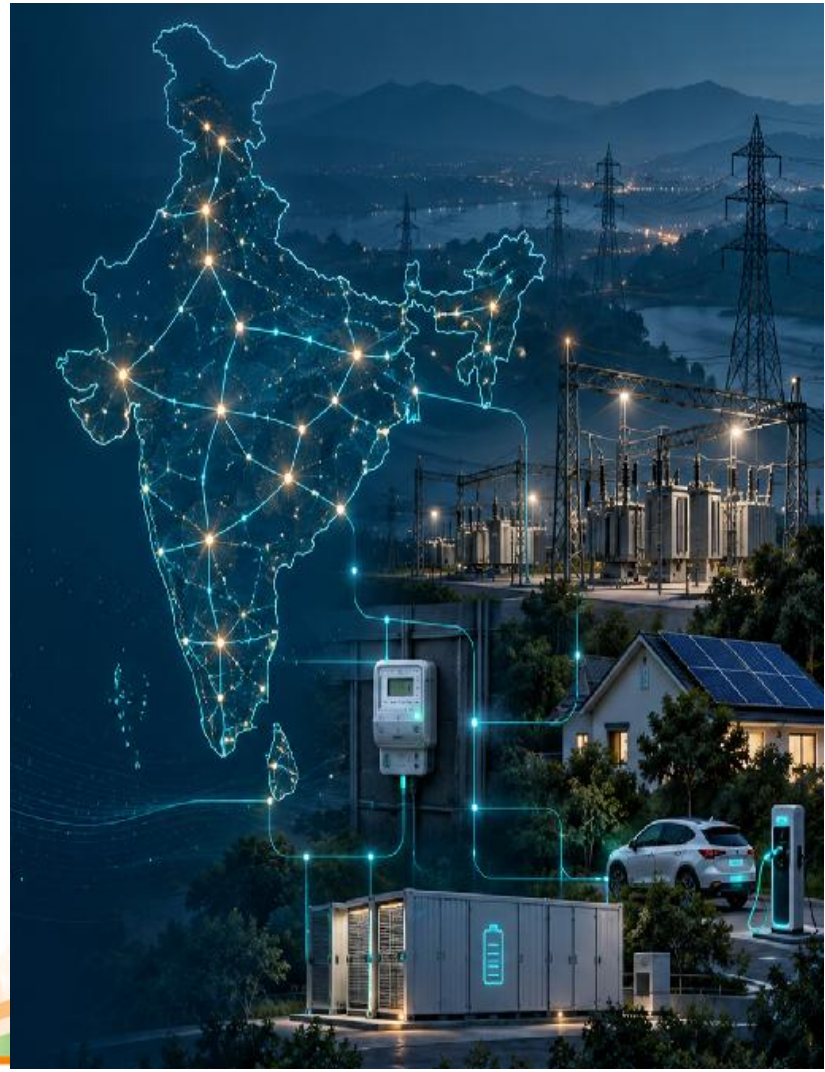

Wind • Solar • Battery storage

- Electric vehicles
- Distributed energy resources

DIGITAL TRANSITION

Metering • Scheduling • Open Access

Allocation • Settlement • Billing

The priority: interoperable, secure, transparent and future-ready digital infrastructure.

Move beyond data collection towards meaningful interoperability

DISTRIBUTION UTILITY MEET DUM 2026

ISGF India Smart Grid Forum

Meter data is the starting point—not the end point.

READ › VALIDATE › ALLOCATE › SETTLE › BILL

Data must move consistently across generators, meter systems, utility operations, Open Access accounting and consumer billing.

India Energy Stack should connect this entire energy transaction lifecycle—not merely connect databases.

Tamil Nadu: Renewable Energy Open Access accounting

01

WIND / SOLAR

Generation and meters

02

AMR / DATA

Collection and validation

03

OA ALLOCATION

Consumer mapping, losses

04

SETTLEMENT

Charges, time blocks, billing

In Tamil Nadu, over 14,000 HT wind, solar and other generator services are read through AMR.
That is roughly 43 million 15-minute blocks every month. Collecting them is the easy part.
The real challenge is validating each block, allocating energy to Open Access consumers, applying charges and losses, and settling accurately.

The India Energy Stack should connect this entire transaction lifecycle, not merely connect databases.

Pilot opportunity: demonstrate an auditable meter-to-bill transaction across participating utility systems.

The energy data must be reliable and commercially accountable

Commercial accuracy depends on trusted data

TECHNICAL TRUST

Accurate time blocks

Synchronized timestamps

Validation and exception handling

COMMERCIAL TRUST

Traceable allocations

Applicable charges and losses

Auditable settlement records

One incorrect reading or allocation may affect generators, consumers and utilities.

Therefore, data quality, time synchronization, traceability, cybersecurity, and regulatory compliance must be integral to the architecture.

India Energy Stack must support emerging technologies

Design for bidirectional electricity and new participants

TODAY

Grid imports

Renewable exports

Open Access allocations

EMERGING

Rooftop solar

PV + battery storage

EV charging and prosumers

REQUIRED

15-minute accounting

Charge / discharge records

Interoperable settlement

Architecture must reflect the physical and commercial direction of energy flow.

Finally, we must focus on practical implementation.

Measure outcomes—not just the volume of data exchanged

01 Interoperability	End-to-end metering through billing
02 Reliability	Validated, synchronized, traceable data
03 Accountability	Cyber security, consent and audit trail; CEA 2026 rules apply to every exchange
04 Impact	Accuracy, efficiency, transparency and trust

The India Energy Stack should transform fragmented energy data into trusted, interoperable and accountable energy transactions.

Let us build a digital foundation for today's grid and for India's clean energy transition.

THANK YOU
